24V power supply for relay protection device

Overview

Selective protection of 24 V DC load circuits EPD24 individually protects loads with the lowest power loss, and an impressive performance in severe conditions.

Key Takeaways

The 24V power supply for a relay protection device is typically provided by a dedicated 24V DC source, which can be an external SELV or PELV power supply, or an internal feed from a busbar system in industrial modules.

Power Supply Sources

In relay protection systems, the 24V DC required to operate the relay coil is usually supplied by one of the following: External 24V DC Power Supply: Many devices require a separate 24V DC power source, which can be a standard industrial DC power supply designed to meet SELV (Safety Extra Low Voltage) or PELV (Protective Extra Low Voltage) standards. These power supplies ensure safe operation and protect against electrical shock, even under fault conditions. Internal Busbar or Module Feed: In modular electronic protection devices like the Eaton PXS24, the 24V supply is often distributed internally via busbars.

One channel may be supplied directly through internal feed terminals, while other channels receive power through the shared busbar system. This design simplifies wiring and improves electromagnetic compatibility. Control System Output: In some relay circuits, the 24V DC can be provided by a programmable logic controller (PLC) or auxiliary device output.

The positive terminal of the 24V supply is connected to the relay coil, and the negative terminal is connected to the common ground of the power supply.

Key Considerations

Polarity: DC relays have assigned polarity; the positive and negative terminals must be correctly connected to the 24V supply. Voltage Type: The power supply must provide a stable 24V DC voltage suitable for the relay's coil rating. Safety Standards: For protection relays, using SELV or PELV sources ensures compliance with safety regulations and reduces the risk of electric shock.

In summary, the 24V power supply for a relay protection device can come from a dedicated external DC source, an internal busbar feed in modular systems, or a control system output, with proper attention to polarity, voltage stability, and safety standards.
