Are compensators in distribution boxes very useful

Overview

Using filters and compensators can have several advantages for your power distribution system, such as reducing harmonic distortion, preventing harmonic resonance and instability, improving power factor, reducing the size and cost of components, and complying with standards. ABSTRACT; Modern Power System is tassel of versatile load comprises of high frequency power electronic devices and distributed generation connected using power electronic converters. All these devices draw Non-Linear Current (NLC) form the system. The NLC distort the source profile and injects. Static var compensator (SVC) is a shunt connected static var generator or absorber whose output is adjusted to exchange capacitive or inductive current to maintain or control specific parameters of the electrical power system (typically bus voltage). Static var compensator system provides dynamic. ions such as Static VAR Compensators (SVC) and Static Synchronous Compensators (STATCOM). It highlights the comparative advantages, limitations, and operational considerations of each method in the context of distrib tion networks. The currents can be reactive, negative or zero sequence, or harmonic.
