Cable laying construction in North Africa

Overview

Marseille, France (Ports Europe) July 9, 2024 – The Medusa project plans an 8,700-km undersea cable linking North African countries – Morocco, Algeria, Tunisia, Libya and Egypt – delivering 5G internet access by 2026. This is a list of terrestrial fibre optic cable projects in Africa. While submarine communications cables are used to connect countries and continents to the Internet, terrestrial fibre optic cables are used to extend this connectivity to landlocked countries or to urban centers within a country. Discovering and tracking projects and tenders is not easy. The project, located in an arid coastal region, required cables capable of withstanding high temperatures, sand erosion, and UV exposure. Since 1935, African Cables, now CBi electric: african cables, has designed and manufactured a comprehensive range of electric power cables at its Vereeniging factory.
