Cable Management on Power Distribution Rack

Overview

Color-Coded Cables: Use color-coded cables for power and network connections to visually differentiate between A & B power supplies, or between data types like fiber and copper. Separate Fiber and Copper: Keep fiber and copper cables on opposite sides of the rack . These guidelines ensure that your system and its cables have optimal clearance for maintenance and other operations. The guidelines also provide guidance in correctly cabling your system and using the appropriate cables. These cables handle critical circuits that must stay up and running. Implement Power Distribution Units (PDU): Organize power with PDUs, and make sure they aren't obstructing the removal of hardware. Mounting. Rack PDUs that enable mass configuration and updating capabilities can free up data center staff to concentrate on more strategic tasks.
