Can a switch be installed without an optical module

Overview

Ethernet ports on switches already integrate Ethernet port modules internally, eliminating the need for optical-electrical conversion. Common Ethernet port types for switches . The switch can operate without a network module, but a blank module (with no ports or SFP slots) is available and should be installed when uplink ports are not required. Use only supported network. You can add or remove SFP modules in your switch without powering off the system. The bidirectional SFP modules combine two SFP optical devices that must be used as a pair to establish the. Description: Huawei switches must use Huawei-certified optical modules. Non-Huawei-certified optical modules cannot ensure transmission reliability and may affect service stability. Huawei is not responsible for any problem caused by the use of non-Huawei-certified optical modules and will not fix. It can be said that without the support of optical modules, switches can hardly connect to long-distance fiber optic networks; without switches, the conversion function of optical modules is meaningless, and a complete data transmission link cannot be formed. Its primary function is to achieve optoelectronic conversion by converting electrical signals into optical signals and vice versa.
