Can network cables replace fiber optic cables

Overview

The short answer is no - RJ45 connectors are designed for electrical Ethernet signals, while fiber optics transmit light pulses through glass or plastic. However, modern networks often combine both technologies. Effective lifecycle management of fiber optic cables, from selection and installation to daily maintenance and replacement, is essential. For more than a century, copper networks were the backbone of communication infrastructure, stretching across cities and neighborhoods both in the ground and overhead. A fiber optic network, in other words, utilizes another media to conduct data transmission between the main and edge network devices. Something like Router -> RJ-45 cable -> RJ-45 to Fiber -> Fiber cable through the wall -> Fiber to RJ-45 -> RJ-45 cable -> computer (or eventually a switch). They're switching to fiber optic Internet providers. They want faster Internet, better customer service, and the ability to choose the programming they want – not packages of channels selected by the cable company.
