Causes of corrosion in distribution boxes

Overview

The corrosion mechanism of stainless steel parts is mainly electrochemical corrosion. Surface contamination: oil, dust, acid, alkali, salt, etc. Surface scratching: The. The distribution box is an important part of the power supply system, and its corrosion problem will directly affect the safe operation of electrical equipment. Therefore, certain measures should be taken to prevent the distribution box from corrosion. Maintaining the structural integrity of the steel enclosures essentially depends on the precise matching of the material's metallurgical. Corroding metals and associated corrosion products in finished water can react with disinfectants, causing areas of low disinfectant residual in the distribution system. Special discounts ap ucation on the National Registry of CPE. Corrosion is a natural phenomenon that has significant implications for businesses including oil and gas, petrochemicals plant, and energy.
