Classification of Transmission Line Relay Protection

Overview

Distance Relay: Operates based on impedance, commonly used in transmission line protection. Earth Fault Relay: Detects leakage currents to the ground. Engineering use: Protection engineers use distance, differential, directional overcurrent, pilot, and backup schemes to. Transmission lines act like the arteries in the human circulatory system, moving electrical power from were it is produced by generators to where it is consumed at load centers. And like arteries in the human body, the loss or damage to transmission infrastructure can have disastrous effects on the. This is under impedance protection, setting of which are calculated on the basis of positive and zero sequence impedance of line be protected which varies linearly with the distance of the line and hence it is called distance protection. Generally line to be protected should trip in the shortest.
