Configuration of a three-level distribution box on the construction site

Overview

The distribution box (cabinet) is suitable for temporary power supply at the construction site and should meet the requirements of "three-level power distribution, two-level leakage protection, one machine one switch, one leakage one box" for power distribution and protection. The power distribution from the power input point to the end electrical equipment needs to go through three levels of Powbinet. This architecture uses the main distribution box as the primary hub, with. Class I distribution box: the construction power distribution cabinet is used for construction power on the construction site. The complete set of products can form a complete three-level. This video details the design standards of this red construction site distribution box, its internal breaker configuration, and how to ensure electrical safety during construction.
