Connecting two wireless routers using fiber optic cable

Overview

How to connect two routers on the same fibre optic lineA common solution is to connect two routers on the same fibre optic line. In this article, Axarfusio.

Key Takeaways

You can connect two wireless routers using a fiber optic connection by linking the primary router to the ONT and connecting the second router via LAN-to-LAN or LAN-to-WAN, configuring it as an access point or secondary network. Step 1: Prepare Your EquipmentFiber optic modem/ONT: Provided by your ISP to convert optical signals to Ethernet. Primary router: Connects directly to the ONT and manages your main network.

Secondary router: Can extend coverage or create a separate network; ensure it supports Access Point (AP) mode or bridging. Fiber optic cable: Typically SC/APC or SC/UPC connectors. Ethernet cables: To link routers and devices.

Step 2: Connect the Primary RouterPlug the fiber optic cable into the ONT.

Connect the ON

T to the WAN port of the primary router using an Ethernet cable. Power on the router and configure it with your ISP settings, including VLAN ID if required. Step 3: Connect the Secondary RouterThere are two common methods: Option A: LAN-to-LAN (Access Point Mode)Connect a LAN port on the primary router to a LAN port on the secondary router using an Ethernet cable.

Set the secondary router to Access Point mode. Assign a static IP within the same subnet as the primary router but outside its DHCP range (e.g., 192. 168.

D and channels to complement the primary router for seamless coverage. Option B: LAN-to-WAN (Secondary Network)Connect a LAN port on the primary router to the WAN port of the secondary router. Configure the secondary router with a different subnet (e.g., 192.

168. 2.x) to create a separate network segment. This setup is useful for guest networks or isolating devices.

Step 4: Optimize Network PerformancePlace routers strategically to minimize interference and maximize coverage. Use different Wi-Fi channels if both routers operate on the same frequency band. Test connectivity and speed in various areas to ensure seamless performance.

Step 5: Additional ConsiderationsEnsure the secondary router supports bridging or AP mode; otherwise, it may not extend the network properly. Avoid connecting two routers directly to the ONT unless your ISP allows multiple public IPs, as this can cause conflicts. For fiber networks, the ONT always acts as the bridge between optical signals and your Ethernet network, so all routers must connect through it either directly or via the primary router.

By following these steps, you can successfully connect two wireless routers via fiber optic infrastructure, extending coverage, improving Wi-Fi performance, or creating separate network segments for different devices or users.
