Disconnection of neutral wire in distribution box

Overview

Power enters your property through the active wire and exits via the neutral wire, completing the circuit. If the neutral wire is broken, this flow is disrupted, potentially causing a surge of voltage that can damage electronics and, in extreme cases, lead to dangerously high. The neutral wire provides a return path for current back to the power source, completing the electric circuit. It is insulated and carries current under normal conditions back to the transformer. If a voltage tester indicates about 70 V to earth, this usually points to leakage or poor grounding in the system. Rapidly locating and resolving such faults is essential. In the. The neutral wire can be broken by a circuit breaker or switch (including disconnect) ONLY if it is broken with the hot lead.
