Does the cable overheat severely inside the cable tray

Overview

Cable overheating: If the cables inside the tray are carrying more current than they are designed for, they can overheat and melt the insulation. This can cause shorts, fires, or damage to equipment. But with more and more cables and longer use, cables getting too hot is a big issue. Here's how it typically unfolds: Heat Generation: Every electrical cable generates some heat. Despite their low profile, cable trays are almost always vital to the operation of a much larger production or communication facility. Some common types of electrical failures include: Cable insulation failure: The insulation around the cables can degrade over time due to exposure to heat. By increasing the resistance of the cable due to the proximity effect with a metal tray.
