Fiber Optic Cable Soldering

Overview

USE OF SOLDERING TECHNOLOGIES IN FIBER ASSEMBLYFraunhofer ILT has been able to demonstrate the use of this innovative soldering technology in fiber assembl.

Key Takeaways

Fiber optic soldering involves permanently joining fiber cables to connectors or substrates using heat and solder, providing stable, high-strength, and low-loss connections.

Overview of Fiber Optic Soldering

Fiber optic soldering is a termination technique where a fiber is fused to a connector or substrate using a heated soldering tip and solder material. Unlike crimping, which is temporary, soldering creates a permanent and stable connection, making it ideal for applications requiring long-term reliability, such as industrial or research laser systems (Neofibers.com). The process typically involves stripping the fiber coating, cleaning the fiber end with flux, and applying heat to melt the solder, which bonds the fiber to the connector.

Advanced Soldering Technologies

Active Soldering

Fraunhofer ILT developed active soldering technology that allows fibers to be mounted on metallic or non-metallic substrates without flux or intermediary layers. This method reduces thermally induced stress, maintains beam properties in polarization-maintaining fibers, and provides high thermal conductivity at the interface. It also enables robust, temperature-resistant, and long-term stable connections suitable for complex laser systems (Fraunhofer ILT).

Induction SolderingHigh-frequency induction soldering uses an induction coil to uniformly heat the fiber assembly. The fiber is placed in a fixture inside the coil, and RF power melts the solder to form a solid joint. This method achieves consistent and repeatable results with short heat cycles (5–7 seconds), depending on the solder type, and is particularly useful for precise industrial applications (DW Induction Heater).

Advantages of Soldering Fiber Optics

Permanent and stable connections suitable for high-reliability applications. High mechanical strength, verified by tensile tests. Efficient thermal management, allowing higher optical power transmission.

Compatibility with complex assemblies, including laser systems and polarization-maintaining fibers. Comparison with Other Termination MethodsCrimping: Simple, cost-effective, and ideal for frequent moves or changes, but less permanent. Fusion Splicing: Provides the lowest attenuation and highest tensile strength but requires specialized equipment.

Soldering: Balances reliability, permanence, and mechanical strength, making it suitable for applications where stability is critical (Neofibers.com). Fiber optic soldering is therefore a highly effective method for creating durable, low-loss connections in both industrial and research environments, with advanced techniques like active and induction soldering enhancing precision and performance.

USE OF SOLDERING TECHNOLOGIES IN FIBER ASSEMBLY

Fraunhofer ILT has been able to demonstrate the use of this innovative soldering technology in fiber assembly. Optical measurements show that in polarization-maintaining fibers, the thermally induced

understanding the differences between crimping, soldering, and fusion ...

In summary, termination techniques are crucial for the optimal performance of fiber optic cables. as such, it is vital to choose the most appropriate termination method based on the application

How to Splice Fiber Optic Cable – Step-by-Step Fusion

Learn how to splice fiber optic cable using fusion splicing with this complete step-by-step guide. Includes tools, best practices, loss standards (ITU

Induction Heating for Fiber Optics

© 2026 EXF OPTICAL NETWORKS - All rights reserved

Induction heating is used for soldering fiber optic ferrules, curing epoxy and melting glass. Ambrell can help with your fiber optic soldering applications.

Hermetically sealing a fiber optic cable in a kovar ferrule

A single turn channel C-shaped coil is used for this soldering application. Assembly is fluxed at the joint area and power is applied for 15 seconds to create the hermetic seal in the ferrule.

High frequency Induction soldering fiber optic cable

Process A specially designed, two-turn plate concentrator coil was used to provide uniform heat to the fiber optic assembly. The assembly was placed in a specially designed fixture, then placed inside the

Soldering

The parts to be joined can be metallized with solder and solder-aiding layers by DC-magnetron sputtering. The coating technology of all layers takes place in one
