How are lighting distribution boxes represented

Overview

In a polar representation, the diagram specifies what sections through the luminaire (C-levels) the curves refer to. Light distribution curves are usually presented in a polar coordinate system. For floodlights, we specify the light distributions in Cartesian coordinatesThe distribution fuse box forms the heart of every electrical system and ensures that lighting systems can be operated safely, efficiently and in accordance with standards. It protects cables and devices from overload, disconnects circuits in the event of a fault and thus guarantees maximum safety. The luminous intensity value in candela (cd) for a given luminaire is obtained by multiplying the value in cd/klm read from the diagram by the total luminous flux in kilolumens (klm) of the lamps. The distribution box (DB box) helps safely and efficiently distribute electrical power. Today, electrical systems are essential for homes and industries. w how power would flow through MV-1 to the lighting panel (LP-1). Single-line ct-specific symbols or acronyms which are defined on the drawing.
