How to tell which port on a splitter is in use

Overview

All you need is the Command Prompt and a few simple commands. Then, type in “netstat” along with the specific parameters to see the status of all your ports. If you're looking for a particular port, you can use the “findstr”. Netstat helps you view active connections, open ports, and running network services. What Is Netstat And Why It Matters?

What Is Netstat And Why It Matters?

Netstat shows active TCP and UDP connections. In this article, you will learn how to find which process or service is listening on a particular port in Linux using ss, netstat, lsof, and fuser commands. The right way to do it just depends on whether you're using a Mac or PC and what kind of port you're checking. Despite their usefulness, there are a few common. Run the command "netstat -ab" in an elevated Command Prompt, PowerShell, or Terminal window to see a list of applications and their associated ports.
