Intelligent power distribution box switches multiple power supplies

Overview

A dual input PDU is a specialized smart PDU rack mount solution designed to enhance power redundancy and ensure reliability in IT environments. It connects to two independent power sources, allowing seamless switching during power failures. The High Power Multi-Input PDU is designed to work across four fused input branches, our Basic units come in a range of outlet. Line-Interactive UPS systems provide both battery backup and automatic voltage regulation of AC power (boost/cut) to give a greater amount of power protection than a Stand-By UPS. On-Line UPS systems use a double power conversion system to produce a pure sine wave output and zero transfer time to. Our intelligent and mechanical boxes in the area of power and data distribution offer modular solutions for all voltage levels and at the same time optimize functionality - for maximum efficiency with maximum safety. It is suitable for AC power systems operating at 50/60Hz with rated voltages up to 230V/400V and current capacities ranging from 6A to 63A. From consulting services to engineering design and construction, to long-term project maintenance, CHINT is willing to work with customers to achieve value. Each output can be switched on/off individually.

Power distribution unit

A power distribution unit (PDU) is a device fitted with multiple outputs designed to distribute electric power, especially to racks of computers and networking equipment located within a data center.

What is a power distribution unit (PDU)?

What do PDUs do? PDUs do essentially the same job as power strips: They supply power to multiple items at once. Data centers and other industrial environments cannot plug all their
