This article presents a review of the methodological approaches used so far in such assessments: i) top–down analyses based on estimates of the overall Internet energy consumption and the overall Internet traffic, whereby average energy intensity is calculated by dividing energy by. Estimates published over the last decade diverge by up to four orders of magnitude — from 0. 0064 kilowatt-hours per gigabyte (kWh/GB) to 136 kWh/GB. It discusses energy-e ciency and the need for a common standard for evaluating the climate impact of future communication technologies and suggests a model that can be. This study identifies representative estimates for the average electricity intensity of fixed-line Internet transmission networks over time and suggests criteria for making accurate estimates in the future.
