An optical power meter (OPM) is a device used to measure the power in an optical signal. The term usually refers to a device for testing average power in fiber optic systems. Other general purpose light power measuring devices are usually called radiometers, photometers, laser power meters (can be photodiode sensors or thermopile laser sensors), light meters or lux meters. A typical optical power meter consists of a calibrated sensor, measuring amplifier and display. The sens

Light Modulation

Here, we discuss how varying the injected current in a semiconductor laser or light emitting diode, or by operating the source with constant output and introducing an external modulator, can realize

Frequency is the number of occurrences of a repeating event per unit of time. Frequency is an important parameter used in science and engineering to specify

Amplitude of Electromagnetic Waves: What It Means and Why It Matters

In optical communication, amplitude modulation (AM) encodes data onto light waves for fiber-optic internet. Even laser pointers use amplitude to determine brightness—too low, and the dot is invisible;

Optical resolution

Optical resolution is the resolved detail of an imaging system by scale. An imaging system may have many individual components, including one or more lenses, and/or recording and display
