Loop test of optical port on switch

Overview

Network Port Diagnostics: You can use a loopback cable to test the functionality of a fiber optic port on a switch, router, or network interface card (NIC) to ensure its Tx and Rx paths are operational. Burn-in Testing: For critical applications, transceivers might be put through a "burn-in" period. Whether you are validating a new deployment or troubleshooting a dead port, the loopback cable is one of the most efficient tools in a network engineer's kit. This guide explains what loopback cables are, the different types available, and how to perform loopback tests to isolate hardware issues. This document describes how to troubleshoot fiber optic interfaces by addressing some of the fiber optic module and cabling specifications. There are no specific requirements for this document. It can be performed internally via network management software, known as a soft loopback, or externally via a physical loopback adapter, known as a hard loopback. The methodology is simple: start at the physical layer and work your way up the stack, confirming each layer before moving to the next.
