Major axis optical cable

Overview

Coaxial cable, or coax, is a type of consisting of an inner surrounded by a concentric conducting, with the two separated by a (material); many coaxial cables also have a protective outer sheath or jacket. The term refers to the inner conductor and the outer shield sharing a geometric axis.

Key Takeaways

A major axis optical cable typically refers to a high-speed fiber optic or active optical cable (AOC) designed for reliable, low-latency data transmission over short to medium distances.

Overview

Major axis optical cables are often implemented as active optical cables (AOCs), which integrate optical transceivers directly into the cable assembly. These cables use fiber optics to transmit data as light pulses, providing higher bandwidth and longer reach than traditional copper cables while consuming less power. The "major axis" can refer to the primary optical path along which light travels, ensuring minimal signal loss and optimal performance.

Construction and Types

Fiber Type: AOCs can use multi-mode or single-mode fibers, depending on the required distance and data rate. Multi-mode fibers are common for short-range connections, while single-mode fibers support longer distances. Integrated Transceivers: The optical transceivers are built into the cable, eliminating the need for separate modules and simplifying installation.

Connectors: Standard MSA connectors such as QSFP+, SFP, iPass+ HD, and CXP are used for compatibility with switches, servers, and storage systems.

Applications

Major axis optical cables are widely used in: Data Centers: Connecting switches, servers, and storage systems with high-density, low-latency links.

High-

Performance Computing (HPC): Supporting GPU-accelerated computing and AI systems with short switch-to-GPU or switch-to-switch links. Telecom and Enterprise Storage: Providing reliable, high-speed connections for SAS, PCIe, and Ethernet networks.

Advantages

High Data Rates: Support for speeds from 10G to 400G depending on the cable type. Low Latency and Power Consumption: Ideal for bandwidth-intensive environments.

Plug-and-

Play: Simplifies deployment without separate transceivers or complex cabling. Reliability: Encased optics reduce maintenance issues like connector contamination or fiber damage.

Summary

A major axis optical cable, in practice, is an active optical cable optimized for high-speed, short- to medium-range data transmission. It combines integrated optical transceivers, multi-mode or single-mode fibers, and standard connectors to deliver efficient, low-latency, and reliable connections for modern data centers, HPC, and enterprise storage applications.

Coaxial cable, or coax, is a type of electrical cable consisting of an inner conductor surrounded by a concentric conducting shield, with the two separated by a dielectric (insulating material); many coaxial cables also have a protective outer sheath or jacket. The term coaxial refers to the inner conductor and the outer shield sharing a geometric axis.
