Multimode Fiber Internet

Overview

Broadband Internet: FTTH (Fiber-to-the-Home) uses a combination of single-mode (for trunk lines) and multimode (for last-mile connections).

Key Takeaways

Multimode fiber (MMF) is a type of optical fiber used for high-speed internet over short distances, ideal for buildings, campuses, and data centers.

Overview

Multimode fiber is designed with a larger core diameter, typically 50 or 62. 5 microns, allowing multiple light modes to propagate simultaneously. This enables high-capacity data transmission over short distances, making it suitable for LANs, enterprise networks, and data centers.

MM

F is generally less expensive than single-mode fiber because it uses LED or VCSEL light sources instead of more costly lasers.

Performance and Distance

Data Rates: Multimode fiber can support speeds up to 10 Gbit/s over typical LAN distances, with some types supporting 40 Gbit/s and 100 Gbit/s for shorter runs. Distance Limitations: Due to modal dispersion, MMF is limited to shorter distances. For example, 10 Gbit/s can reach up to 550 meters, while lower speeds like 100 Mb/s can extend up to 2 km.

Types of Multimode Fiber

Multimode fibers are classified according to the ISO 11801 standard: OM1: 62. 5 µm core, orange jacket, LED source, supports 10 Gbit/s up to 33 meters, commonly used for 100 Mb/s Ethernet. OM2: 50 µm core, orange jacket, LED source, supports 10 Gbit/s up to 82 meters, often used for 1 Gbit/s Ethernet.

OM3: 50 µm core, aqua jacket, optimized for laser-based equipment, supports 10 Gbit/s up to 300 meters, and 40/100 Gbit/s up to 100 meters. OM4: Backwards compatible with OM3, supports 10 Gbit/s up to 550 meters, designed for VCSEL laser transmission. OM5: Wideband multimode fiber (WB-MMF), supports short-wavelength division multiplexing (SWDM), ideal for multi-wavelength 40/100 Gbit/s applications.

AdvantagesCost-effective: Lower-cost transceivers and electronics compared to single-mode fiber. High capacity: Can handle multiple data streams simultaneously. Ease of installation: Suitable for short-range connections within buildings or campuses.

Limitations

Shorter reach: Not suitable for long-distance or backbone connections beyond a few hundred meters without repeaters or switches. Modal dispersion: Multiple light paths can cause signal spreading, limiting maximum distance and speed.

Use Cases

Enterprise LA

Ns: Connecting switches, servers, and workstations within a building. Data centers: High-speed interconnects between racks and storage systems. Campus networks: Linking multiple buildings over short distances.

In summary, multimode fiber internet is ideal for high-speed, short-distance networking where cost efficiency and high bandwidth are priorities. For longer distances or backbone connections, single-mode fiber is generally preferred due to its superior signal integrity and extended reach.
