Optical Module Information Transmission Network

Overview

Optical modules, also known as optical transceivers, are essential components that convert electrical signals to optical signals and vice versa. They form the backbone of long-distance, high-capacity data transport in modern telecom networks. The Optical Transport Network (OTN) is an internationally standardized set of protocols that define how digital signals are encapsulated, multiplexed, and transported across optical fiber infrastructure. This assembly comprises a light source, such as a laser diode or a semiconductor light-emitting diode (LED), an optical interface, a. Huawei OptiXtrans DC908 series is a leading intelligent Data Center Interconnect (DCI) product. One-click automatic deployment, smart and proactive O&M based on intelligent algorithms are the key features. Deployed across fronthaul, midhaul, and backhaul.

Optical transport network

An optical transport network (OTN) is a digital wrapper that encapsulates frames of data, to allow multiple data sources to be sent on the same channel. This creates an optical virtual private network for each client signal. ITU-T defines an optical transport network as a set of optical network elements (ONE) connected by optical fiber links, able to provide functionality of transport, multiplexing
