Relay Protection for a 10k Transformer

Overview

Transformers of 10 000 kVA and larger, three-phase, minimum nameplates (Categories III and IV) are generally protected by a combination of protective devices. Since transformers are among the most expensive and critical components in power systems, proper protection is essential to prevent costly damage and ensure reliable operation. criteria for protection schemes. Basler Electric is a manufacturer of excitation systems, voltage regulators, genset controls, protective relays, custom transformers, and injection molded plastic components. Basler also offers turnkey engineering services through their Basler Services, LLC subsidiary. Setting procedures are only discussed in a general nature in the material to follow. In some cases, a user may apply the techniques described in this guide for protecting. Transformers are protected by fuses or circuit-interrupting devices such as breakers or circuit switchers with relays detecting faults and providing trip signals to the circuit-interrupting devices.
