# Residual current switch in home electrical panel

## Overview

RCDs, or Residual Current Devices, are life-saving safety switches that prevent electric shocks and fires. This article explains RCDs, how they work, and why you need one in your home. Discover the difference between Type A and Type B RCDs, and learn how to choose the right one. A residual-current device (RCD), residual-current circuit breaker (RCCB) or ground fault circuit interrupter (GFCI) is an electrical safety device, more specifically a form of Earth-leakage circuit breaker, that interrupts an electrical circuit when the current passing through line and neutral. Knowing the exact function of each switch on the electrical panel will help you to figure out the cause each time the electricity cuts out, and thus avoid greater problems. What is an electrical panel, and what is it used for?

Although we colloquially call it the electrical panel, its technical. An RCCB (Residual Current Circuit Breaker) is an essential component in numerous electrical installations that are integrated with the role of preventing electric shock and fire due to leakage current. Operating silently in a home or industrial electrical panel, it constantly monitors the flow of electricity.
