# Switch Loop Access Solution

## Overview

This guide will help you detect and fix network loops using Spanning Tree Protocol (STP), switch configuration adjustments, and loop prevention techniques. What Causes a Network Loop?

A network loop can occur due to: Redundant Cable Connections – Multiple physical links between. Our existing design is quite simple, it consists of several switches acting as layer 2 (around 6-7) and all of them are connected to a switch through single interface trunk ports. This switch is connected to a firewall which is the gateway for all VLANS defined, which are extended in all the. Switching loops occur when redundant paths are used in a network, confusing switches and multiple copies of the same frame. They are a thorn in the side of any network administrator. There are. They give you the topology visibility, STP monitoring, and real-time alerting you need to identify loop conditions before or immediately after they occur — and fix them without a site visit.
