Three-level two-protection distribution box

Overview

Employs a two-tiered protection approach with residual current devices in both the final switch boxes and the preceding sub-distribution or main distribution boxes. The principle of "one machine, one switch, one leakage, one box, one. That is, a distribution electric box is arranged under the general distribution box, and a switch box is arranged under the switch box, and electrical equipment is arranged under the switch box to form a three-level distribution. After stepping down the voltage through the transformer's low-voltage side (0. 4kV), power distribution is achieved through three levels of distribution boxes: the main distribution board, secondary. Secondary distribution boxes, also known as sub-distribution boxes, generally serve specific power supply areas. Tertiary distribution boxes, or. The second-level distribution box is from the power line of the first-level distribution box to the temporary electricity Applicable to construction site construction electricity, it is specially designed for the special situation of the project construction site and meets the relevant construction.
