Vanuatu Household Distribution Box Model

Overview

Republic of Vanuatu Single-phase American-style box transformerSingle-phase American-style box transformers are generally used in places where single-phase.

Key Takeaways

The Vanuatu Household Distribution Box Model is based on HIES and NSDP survey data, representing household income, expenditure, and socio-economic characteristics across urban and rural areas.

Overview

The Household Distribution Box Model in Vanuatu is derived from the Household Income and Expenditure Surveys (HIES) and the National Sustainable Development Plan (NSDP) Baseline Survey. These surveys collect detailed information on household income, expenditure, subsistence activities, assets, and demographic characteristics, enabling the construction of statistical models that categorize households by income, poverty status, and consumption patterns.

Key Components

Income and Expenditure: HIES captures both cash income and in-kind subsistence production, including food from land and sea, firewood, handicrafts, and household supplies. The 2019-20 HIES provides updated data for poverty and inequality analysis. Poverty Lines: The surveys define Food Poverty Lines and Basic Needs Poverty Lines, which are used to classify households into categories such as food-poor, basic-needs poor, and non-poor.

For example, in 2019-20, 15. 9% of the population lived below the basic-needs poverty line, with stark urban-rural differences: 2% in urban areas versus 20. 8% in rural areas.

Household Characteristics: The NSDP Baseline Survey includes household-level data on water access, sanitation, cooking fuel, transportation, assets, communication, and economic activities such as agriculture, fishing, and handicrafts. These variables allow households to be grouped into distribution boxes reflecting socio-economic status and livelihood strategies.

Urban-

Rural Distribution: The model accounts for geographic disparities. Most poor households are in rural areas, reflecting limited access to non-agricultural employment and vulnerability to natural disasters and economic shocks. Subsistence and Livelihoods: Many households engage in subsistence production, which mitigates food poverty but is sensitive to environmental and economic disruptions.

This is a critical factor in the distribution model, as it affects household consumption and income classification.

Applications

Poverty Analysis: Identifying households below food and basic-needs poverty lines. Policy Planning: Informing social protection programs like the Universal Cash Transfer (UCT) initiative.

Monitoring SD

Gs: Linking household data to over 40 SDG indicators, including health, education, and economic well-being. Consumer Price Index and National Accounts: Updating economic baselines for policy and planning.

Conclusion

The Vanuatu Household Distribution Box Model is a data-driven framework that uses HIES and NSDP survey data to categorize households by income, expenditure, and socio-economic characteristics. It highlights urban-rural disparities, subsistence livelihoods, and poverty incidence, providing a foundation for policy-making, social protection, and sustainable development monitoring.
