What is a department-level core switch

Overview

A core switch is a high-capacity network switch that functions as a network's backbone or core layer. It's responsible for accurately routing communication among layers and departments of different sections. In a nutshell, it helps convey vast chunks of data at greater speeds. Engineered to aggregate massive volumes of data from distribution switches, it provides ultra-low latency and maximum throughput to ensure uninterrupted routing and packet. A core switch is the backbone of a large-scale network, designed to handle massive volumes of traffic with ultra-low latency and maximum reliability. Simply put, it's the kingpin that keeps your network humming. You may also want to know: Can a Nintendo Switch Play DS Games?
