What is the transmission rate of multimode fiber

Overview

Multi-mode optical fiber is a type of optical fiber mostly used for communication over short distances, such as within a building or on a campus. Multi-mode fiber has a fairly large core diameter that enables multiple light modes to be. Multimode fiber (MMF) is an optical fiber designed to carry multiple light propagation paths—or modes—simultaneously. 5 microns, compared to the ~9-micron core in single-mode fiber. Multimode fiber typically operates at a wavelength of 850 nm as it allows. Multimode Fiber (MMF) has a core diameter, typically 50–100 micrometers, has ability to transfer multiple modes of light through the fiber core, uses lower-cost electronics (LED, VCSEL) operates at the 850 nm and 1300 nm wavelength and is used for short distance interconnections (up to 550m). Below is a detailed guide to help you understand how multimode (OM1-OM5) and singlemode (9/125SM) fibers perform at 1GB, 10GB, 40GB, and 100GB.
