What type of pigtail is used for multimode optical modules

Overview

Optical modules must match the Fiber Optic Pigtails; short-wavelength modules should connect to multimode pigtails, and long-wavelength modules should connect to single-mode patch cords to ensure accurate data transmission. Despite this ubiquity, they remain a source of confusion for procurement teams and junior installers alike—especially when it comes to connector type selection, polish type, and the tradeoffs between mechanical. ETU-LINK offers a wide range of pigtails to choose from, based on fiber mode (multimode OM1, OM2, OM3, and single-mode OS2), fiber count (single, dual, multiple), and connector polish types (PC, UPC, APC). Pigtails are covered with an outer sheath that protects the tight-buffered cable from damage. High-quality fiber optic pigtails for terminating and splicing in any network environment. The connector end plugs into devices like transceivers or patch panels, while the bare end is typically fusion spliced to a fiber optic cable.
