Which type of fiber optic cable is used for optical cross-connect testing

Overview

Patch cords play a critical role in connecting network devices and are essential for testing fiber optic networks, ensuring proper signal transmission and compatibility between various fiber types. These cables are used mainly for digital audio connections between devices. A fiber-optic cable, also known as an optical-fiber cable, is an assembly similar to an electrical cable but containing one or more optical fibers that are used to carry light. They provide light-speed transmission, low latency, and future-ready bandwidth — advantages that copper cables cannot match. In essence, an OXC uses photonic switching fabric to route wavelength channels from any incoming fiber to any outgoing fiber. Fiber Optics or Optical Fiber is a technology that transmits data as a light pulse along a glass or plastic fiber. As data rates increase from 10G → 100G → 400G → 800G, patch cables must handle more bandwidth, more density, and stricter.
