Why can t fiber optic cables be directly spliced with patch cords

Overview

Patch cords aren't for permanent splicing; they're for reconfigurable front-side patching. Pigtails create the back-end interfaces. When you build or upgrade a fiber network, the same four words pop up everywhere— fiber optic (bare fiber), pigtail, patch cord, optical cable. Mixing them up drives costs higher, increases loss, and slows your rollout. The good news?

Once you nail. When deploying fiber optic cabling, one of the most critical decisions is how to terminate the fiber—either by splicing or using connectors. We'll explain what each method. Fiber optic joints or terminations are made two ways: 1) splices which create a permanent joint between the two fibers or 2) connectors that mate two fibers to create a temporary joint and/or connect the fiber to a piece of network gear.
